
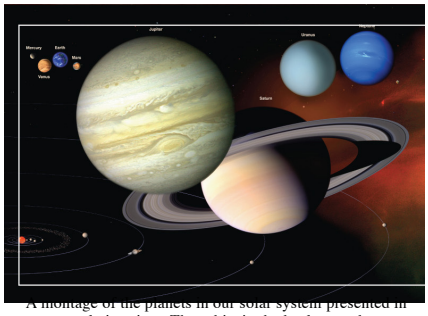
1

Orbital Characteristics of the Planets

	Average distance from Sun		Orbital period	Orbital eccentricity	Orbital inclination
	(AU)	(10^6 km)	(year)	(e)	
Mercury	0.39	58	0.24	0.206	7.01°
Venus	0.72	108	0.62	0.007	3.39°
Earth	1.00	150	1.00	0.017	0°
Mars	1.52	228	1.88	0.093	1.85°
Jupiter	5.20	778	11.86	0.048	1.30°
Saturn	9.54	1427	29.46	0.054	2.48°
Uranus	19.19	2871	84.01	0.047	0.77°
Neptune	30.06	4497	164.79	0.009	1.77°

2

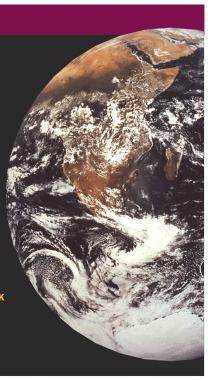


A montage of the planets in our solar system presented in correct relative sizes. The orbits in the background are also drawn to scale.

3

table 9-1 Earth Data

Average distance from the Sun:	1.000 AU = 1.496×10^8 km
Maximum distance from the Sun:	1.017 AU = 1.521×10^8 km
Minimum distance from the Sun:	0.983 AU = 1.471×10^8 km
Eccentricity of orbit:	0.017
Average orbital speed:	29.79 km/s
Orbital period:	365.256 days
Rotation period:	23.9345 hours
Inclination of equator to orbit:	23.45°
Diameter (equatorial):	12,756 km
Mass:	5.974×10^{24} kg
Average density:	5515 kg/m^3
Escape speed:	11.2 km/s
Albedo:	0.39
Surface temperature range:	Maximum: 60°C = 140°F = 333 K Mean: 14°C = 57°F = 287 K Minimum: −90°C = −130°F = 183 K
Atmospheric composition (by number of molecules):	78.08% nitrogen (N_2) 20.95% oxygen (O_2) 0.035% carbon dioxide (CO_2) about 1% water vapor



4

Temperature profile of Earth's atmosphere

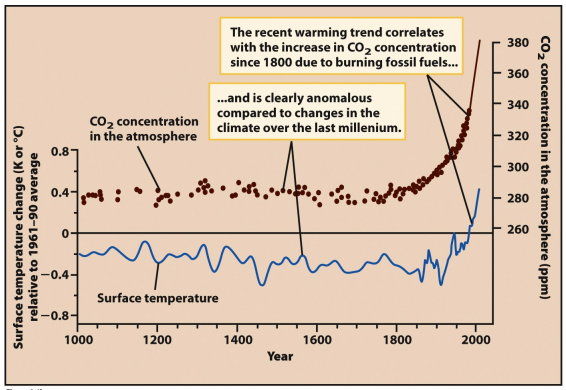
6



7

Average surface temperature of planet

$P_{abs}=(L/4\pi d^2) \times \pi r_p^2$ (1-albedo)

$P_{em}=4\pi r_p^2 \sigma T_p^4$

If no atmosphere then for thermal equilibrium:

$P_{abs} = P_{em}$

$T_p = [L/(4\pi d^2) \times (1\text{-albedo})/(4\sigma)]^{1/4}$

Example for Earth:

$L=3.86 \times 10^{26}$ W, $d=1.5 \times 10^{11}$ m, albedo = 0.37,
$\sigma=5.67 \times 10^{-8}$ J $m^{-2}K^{-4}s^{-1}$

T_p = 247 K

With average T=290K ➔ 43K due to greenhouse effect

8

Surface of Earth (crust), Floating on a layer of denser material.

Alfred Wegener
1912-1915 observations
Africa and South America fit

Hypothesis:
Continental drift

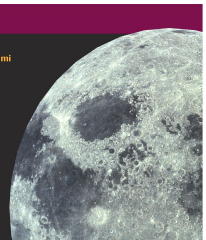
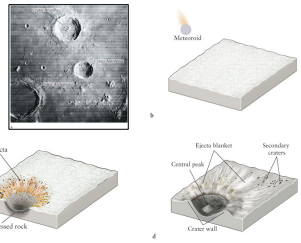
26

table 10-1 Moon Data

Distance from Earth (center to center):	Average: 384,400 km = 238,900 mi Maximum (apogee): 405,500 km Minimum (perigee): 363,300 km
Eccentricity of orbit:	0.0549
Average orbital speed:	3680 km/h
Sidereal period (relative to fixed stars):	27.322 days
Synodic period (new moon to new moon):	29.531 days
Inclination of lunar equator to orbit:	6.68°
Inclination of orbit to ecliptic:	5.15°
Diameter (equatorial):	3476 km = 2160 mi = 0.272 Earth diameter
Mass:	7.349×10^{22} kg = 0.0123 Earth mass
Average density:	3344 kg/m³
Escape speed:	2.4 km/s
Surface gravity (Earth = 1):	0.17
Albedo:	0.11
Average surface temperatures:	Day: 130°C = 266°F = 403 K Night: −180°C = −292°F = 93 K
Atmosphere:	Essentially none



27



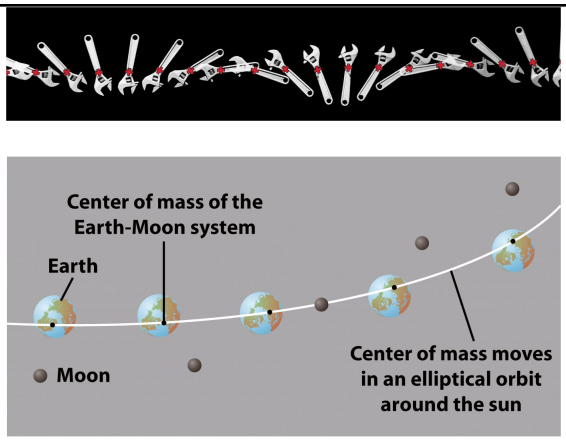
(b) An incoming meteoroid, (c) upon impact, is pulverized and the surface explodes outward and downward. (d) After the impact, the ground rebounds, creating the central peak and causing the crater walls to collapse. The lighter region is the ejecta blanket.

28

A Microscopic Lunar Crater

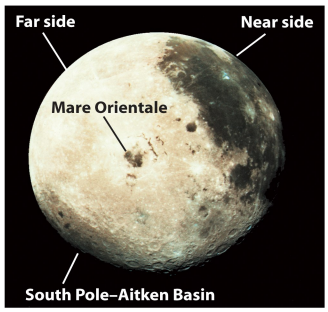
This photograph, made with a microscope, shows tiny microcraters less than 1 mm across on a piece of Moon rock.

29



30

The Moon's airless, dry surface is covered with plains and craters

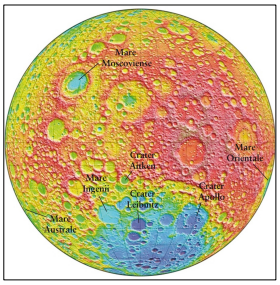


The Earth-facing side of the Moon displays light-colored, heavily cratered highlands and dark-colored, smooth-surfaced maria

The Moon's far side has almost no maria

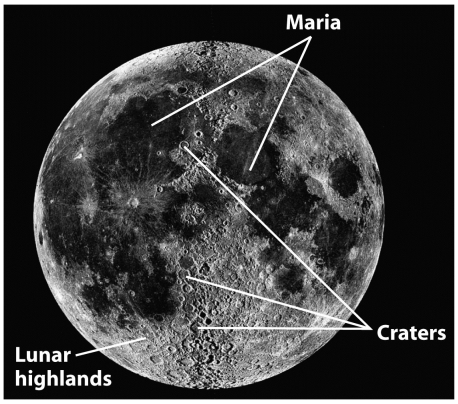
31

The Far Side of the Moon

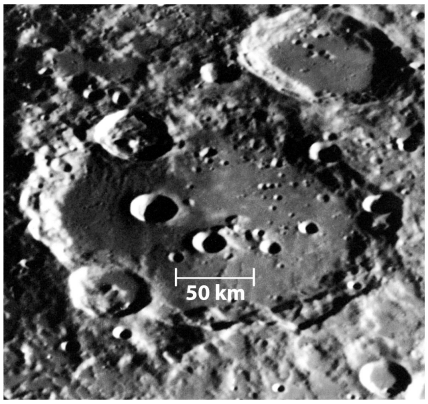


Using a laser mounted on the *Lunar Reconnaissance Orbiter*, this detailed image of the lunar far side was made in 2010. Going by the colors of the rainbow, violet indicates lowest terrain, while red indicates highest.

32



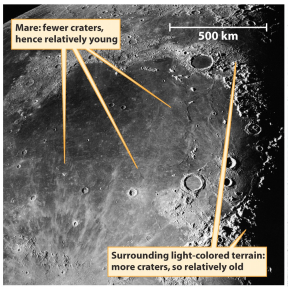
33

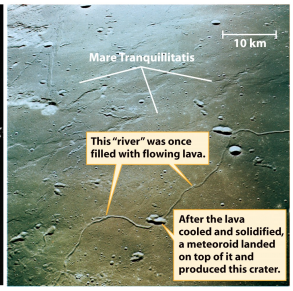


Virtually all lunar craters were caused by space debris striking the surface

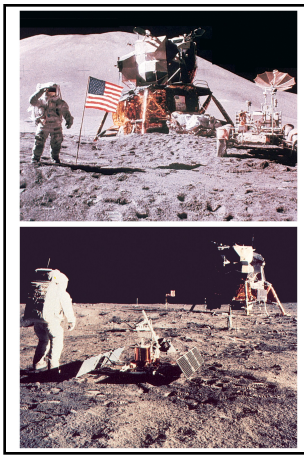
There is no evidence of plate tectonic activity on the Moon

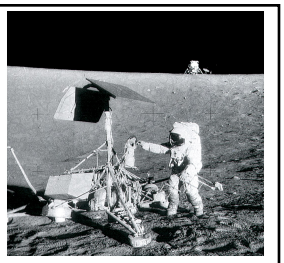
34





35

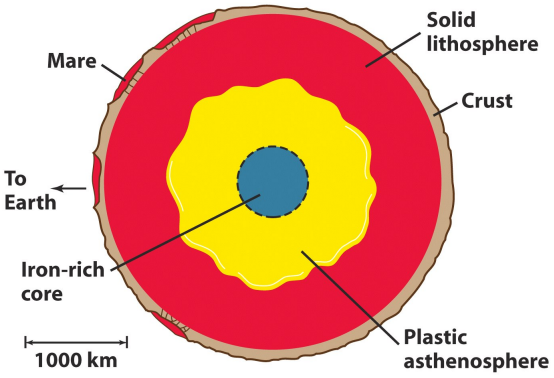




Much of our knowledge about the Moon has come from human exploration in the 1960s and early 1970s and from more recent observations by unmanned spacecraft

36

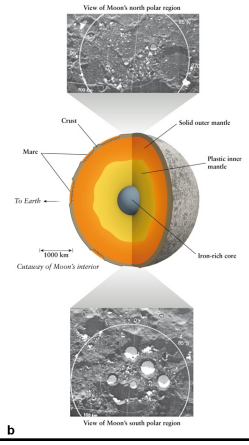
The Moon has no global magnetic field but has a small core beneath a thick mantle



37

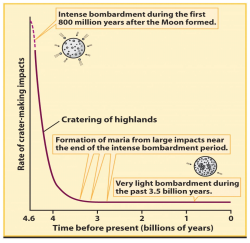
Seismic experiments revealed that the main regions of the Moon's interior mimic those of Earth, but in different proportions.

Water ice may exist in the polar craters, where the energy received from the Sun is insufficient to melt it.



38

Lunar rocks reveal a geologic history quite unlike that of Earth



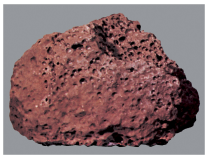
- The anorthositic crust exposed in the highlands was formed between 4.0 and 4.3 billion years ago
- The mare basalts solidified between 3.1 and 3.8 billion years ago
- The Moon's surface has undergone very little change over the past 3 billion years

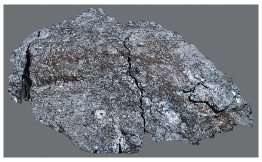
39

- Meteoroid impacts have been the only significant "weathering" agent on the Moon
- The Moon's regolith, or surface layer of powdered and fractured rock, was formed by meteoritic action

40

All of the lunar rock samples are rocks formed largely of minerals found in terrestrial rocks





- The lunar rocks contain no water
- They differ from terrestrial rocks in being relatively enriched in the refractory elements and depleted in the volatile elements

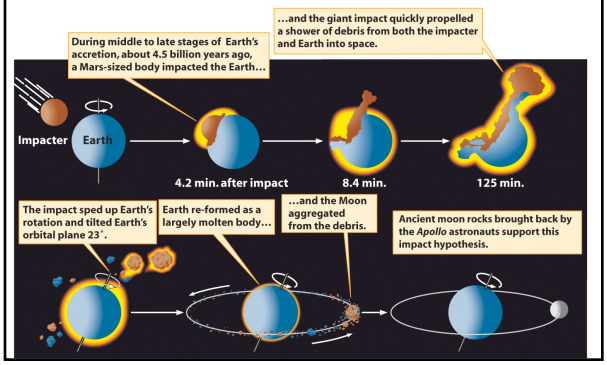
41

The Moon probably formed from debris cast into space when a huge planetesimal struck the proto-Earth

- The collisional-ejection theory holds that the proto-Earth was struck by a Mars-sized protoplanet and that debris from this collision coalesced to form the Moon
- This theory successfully explains most properties of the Moon
- The Moon was molten in its early stages, and the anorthositic crust solidified from low-density magma that floated to the lunar surface
- The mare basins were created later by the impact of planetesimals and filled with lava from the lunar interior

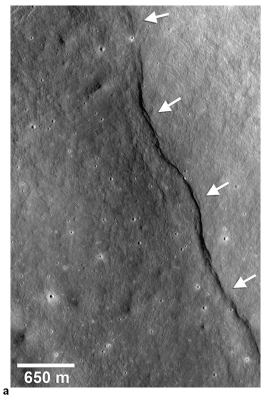
42

The Moon probably formed from debris cast into space when a huge planetesimal struck the proto-Earth



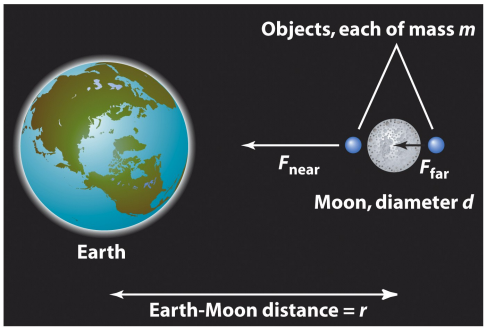
43

As the Moon's interior shrank, the surface settled irregularly, creating long lines of cliffs called scarps.



44

Tidal Forces



45

Tidal forces depend very strongly on the distance between two celestial bodies. They are very strong for the Earth-Moon system. Here is the math:

$$F_{near} - F_{far} = F_{tidal}$$

$$F_{tidal} = \frac{dF}{dr}\Delta r = \frac{d}{dr}\frac{GM_{Earth}m_{bulge}}{r^2_{\text{Tidal forces}}}\Delta r$$

$$F_{tidal} = -\frac{2GM_{Earth}m_{bulge}}{r^3}\Delta r$$

$$m_{bulge} = \frac{A}{r^3}$$

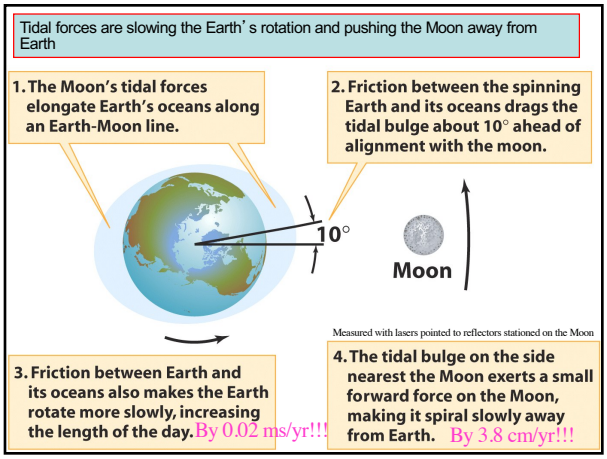
$$\Delta r = -d$$

$$F_{tidal-net} = A\frac{2GM_{Earth}}{r^6}d$$

$$\frac{F_{tidal-net-perigee}}{F_{tidal-net-apogee}} = \left(\frac{r_{perigee}}{r_{apogee}}\right)^{-6} = \left(\frac{363{,}300}{405{,}500}\right)^{-6} = 1.93$$

46

Tidal forces are slowing the Earth's rotation and pushing the Moon away from Earth

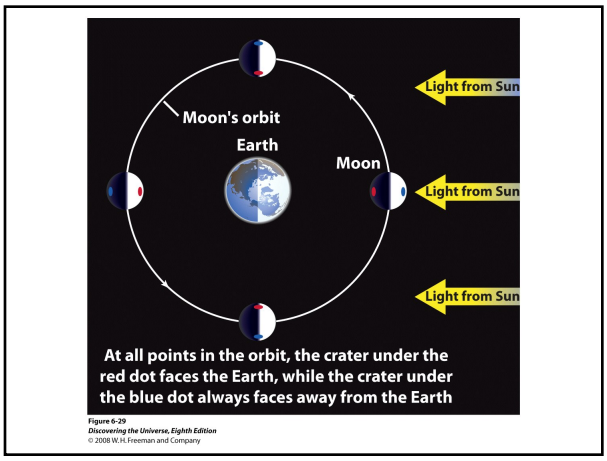


47

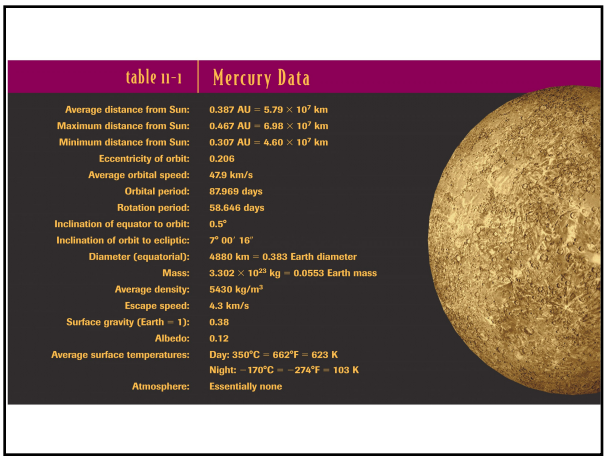
Why do we see only one side of the moon from earth?

⇒ Tidal forces cause the moon to be in synchronous rotation.

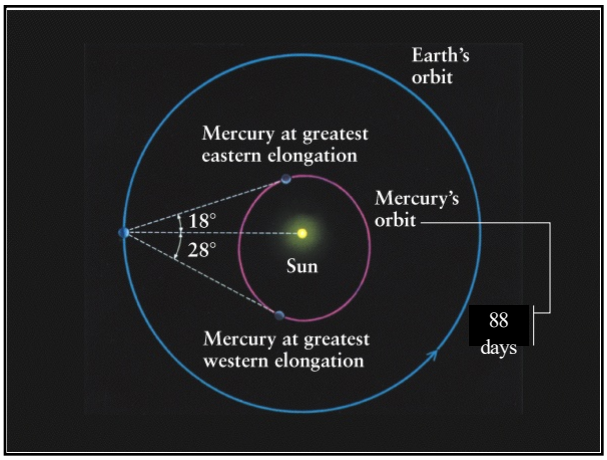
48



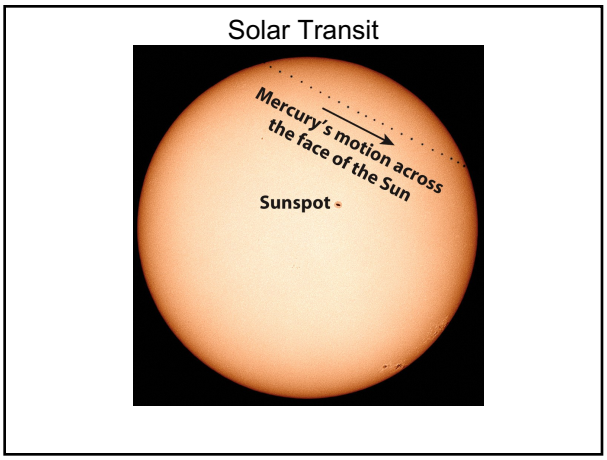
49



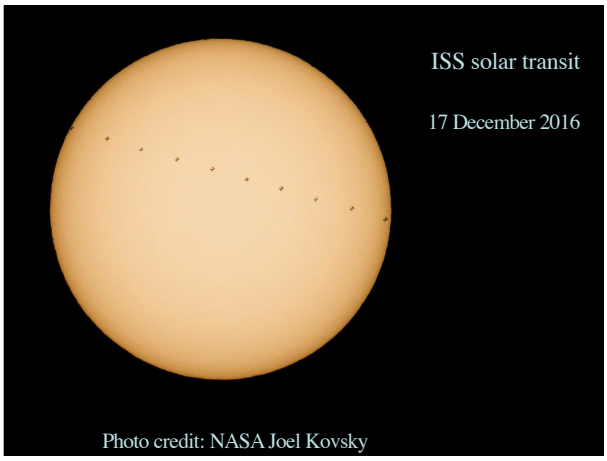
50



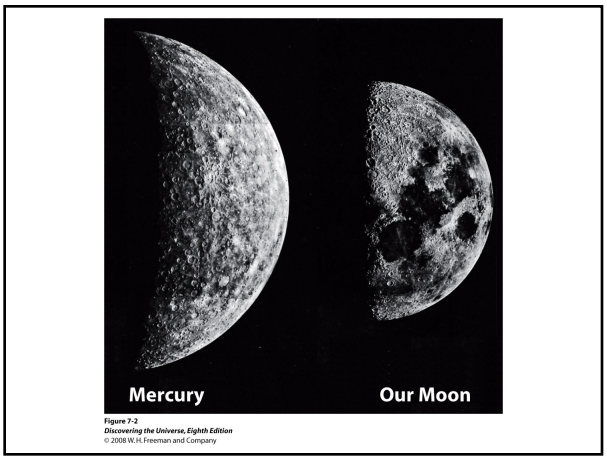
51



52

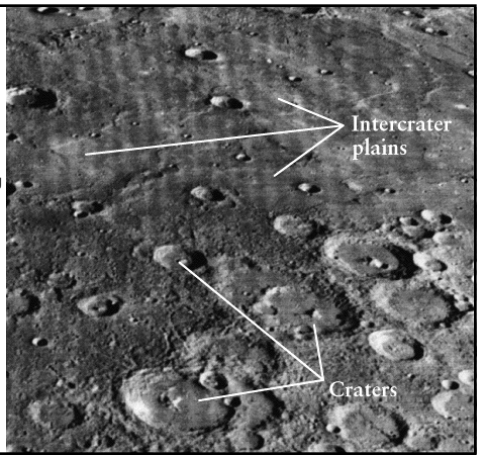


53



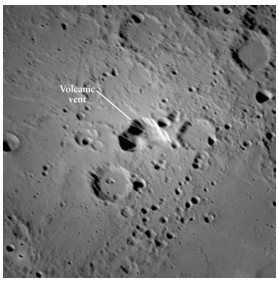
54

- Heavily cratered surface
- Less dense cratering than moon
- Gently rolling plains
- Scarps
- No evidence of tectonics



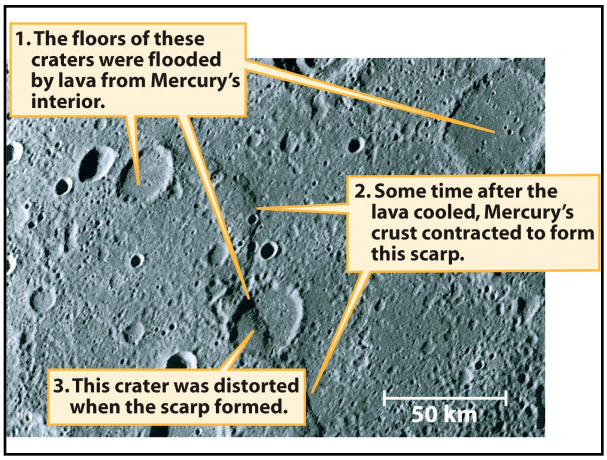
55

Possible Volcanic Vent

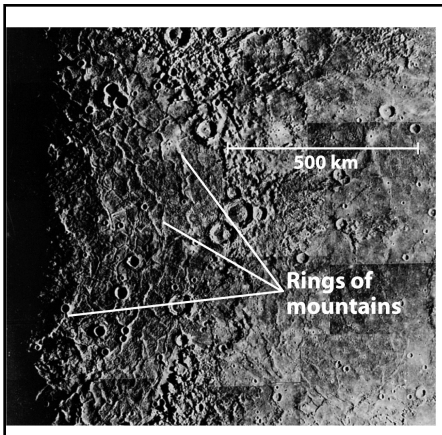


The central indentation in this *Messenger* image from 2009 is believed to be a caldera (sunken vent) of an explosive volcano on Mercury. It is unlikely to be an impact crater, as it completely lacks a raised crater wall.

56



57



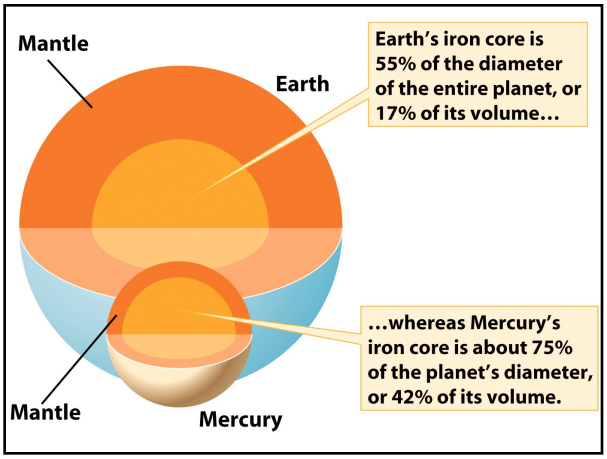
The Caloris Basin is evidence of a large impact

58

Mercury has an iron core and a surprising magnetic field

- Most iron-rich (relative to mass) planet in the solar system with a core that is 75% of the diameter
- The earth's core is 55% of its diameter and the moon's core is 20% of its diameter
- Among highest density for the planets
- Weak magnetic field indicating part of the core is liquid
- Magnetic field causes a magnetosphere similar to Earth's but weaker

59



60

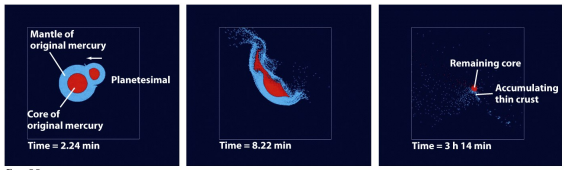


Figure 7-7
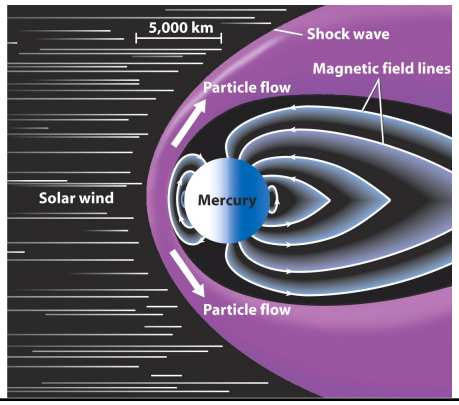
Discovering the Universe, Eighth Edition
© 2008 W. H. Freeman and Company

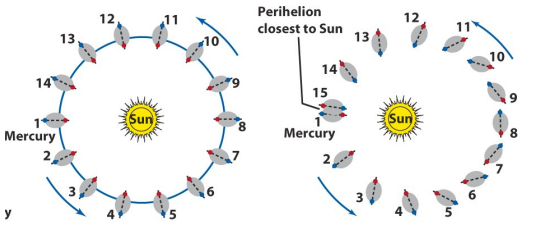
61

The (weak) magnetosphere blocks the solar wind from reaching the surface of the planet



62

Mercury rotates slowly and has a 3-to-2 spin-orbit coupling



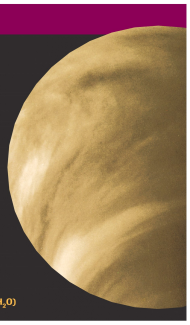
(b) If Mercury were in a circular orbit, its long axis would always point toward the Sun: Mercury would be in synchronous rotation (1-to-1 spin-orbit coupling).

(c) In fact Mercury is in an elliptical orbit, and its long axis only points toward the Sun at perihelion: Mercury spins on its axis 1½ times during each complete orbit (3-to-2 spin-orbit coupling).

63

table 12-1 Venus Data

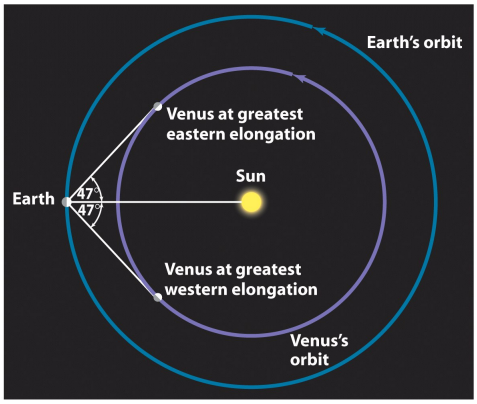
Average distance from Sun:	0.723 AU = 1.082×10^8 km
Maximum distance from Sun:	0.728 AU = 1.089×10^8 km
Minimum distance from Sun:	0.718 AU = 1.075×10^8 km
Eccentricity of orbit:	0.0068
Average orbital speed:	35.0 km/s
Orbital period:	224.70 days
Rotation period:	243.01 days (retrograde)
Inclination of equator to orbit:	177.4°
Inclination of orbit to ecliptic:	3.39°
Diameter (equatorial):	12,104 km = 0.949 Earth diameter
Mass:	4.868×10^{24} kg = 0.815 Earth mass
Average density:	5243 kg/m³
Escape speed:	10.4 km/s
Surface gravity (Earth = 1):	0.91
Albedo:	0.59
Average surface temperature:	460°C = 860°F = 733 K
Atmospheric composition (by number of molecules):	96.5% carbon dioxide (CO_2) 3.5% nitrogen (N_2), 0.003% water vapor (H_2O)



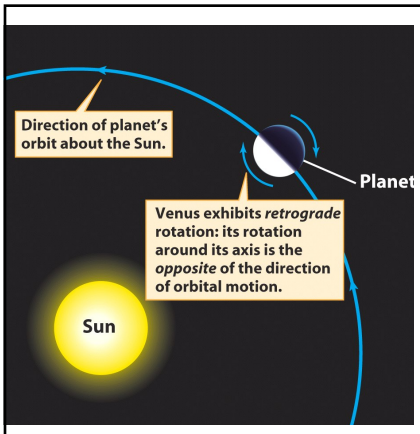
64

Figure 7-9
Discovering the Universe, Eighth Edition
© 2008 W. H. Freeman and Company

65



66



- Venus rotates slowly in a retrograde direction with a solar day of 117 Earth days and a rotation period of 243 Earth days
- There are approximately two Venusian solar days in a Venusian year.

67

Venus has a hot, dense atmosphere and highly reflective corrosive cloud layers

- Spacecraft measurements reveal that 96.5% of the Venusian atmosphere is carbon dioxide
- Most of the balance of the atmosphere is nitrogen.
- Venus' s clouds consist of droplets of concentrated sulfuric acid.
- The surface pressure on Venus is 90 atm, and the surface temperature is 460° C
- Both temperature and pressure decrease as altitude increases

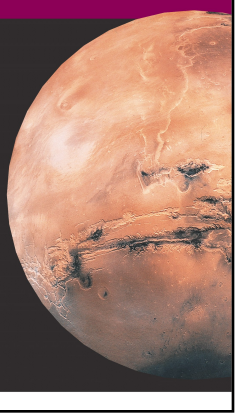
75

table 13-1 Mars Data

Average distance from Sun:	1.524 AU = 2.279 × 10^8 km
Maximum distance from Sun:	1.666 AU = 2.492 × 10^8 km
Minimum distance from Sun:	1.381 AU = 2.067 × 10^8 km
Eccentricity of orbit:	0.093
Average orbital speed:	24.1 km/s
Orbital period:	686.98 days = 1.88 years
Rotation period:	$24^h\ 37^m\ 22^s$
Inclination of equator to orbit:	25.19°
Inclination of orbit to ecliptic:	1.85°
Diameter (equatorial):	6794 km = 0.533 Earth diameter
Mass:	6.418 × 10^{23} kg = 0.107 Earth mass
Average density:	3934 kg/m^3
Escape speed:	5.0 km/s
Surface gravity (Earth = 1):	0.38
Albedo:	0.15
Surface temperatures:	Maximum: 20°C = 70°F = 293 K Mean: −53°C = −63°F = 220 K Minimum: −140°C = −220°F = 133 K
Atmospheric composition (by number of molecules):	95.3% carbon dioxide (CO_2) 2.7% nitrogen (N_2) 0.03% water vapor (H_2O) 2% other gases



76

The Martian surface has numerous craters, several huge volcanoes, a vast rift valley, and dried-up riverbeds— but no canals.

Martian volcanoes and the Valles Marineris rift valley were formed by upwelling plumes of magma in the mantle.

105

Why is there no H_2 in the atmosphere of the inner planets?

$E_k=1/2mv^2$	J	Kinetic energy due to motion with velocity, v
$E_k=3/2kT$	J	Thermal kinetic energy of gas, atoms or molecules
$v=(3kT/m)^{1/2}$	m/s	Average speed of a gas, atom or molecule
$k=1.38x10^{-23}$	J/K	Boltzmann's constant
$m = \mathcal{M}$ x amu	kg	mass of atom or molecule
$\mathcal{M}$		mass number
amu= 1.66×10^{-27} kg		atomic mass unit

Example for Mars: T=220K, H_2 : $\mathcal{M}$=2, m= $2x1.66x10^{-27}$ kg
$v=[(3x1.38x10^{-23}x220/(2x1.66x10^{-27})]^{1/2}$ =1656 m/s

A planet or moon can retain a gas if the escape speed is at least 6 times greater than the average velocity of the gas.

106

What is the escape velocity for Mars?

$v^2_{escape} = 2GM/r$
$M = 6.418x10^{23}$ kg (mass of Mars)
r=3397 km (radius of Mars)

$v^2_{escape} = 2 \times 6.673x10^{-11} \times 6.418x10^{23} / (3.397 \times 10^6) = 25.214 \times 10^6$ $(m/s)^2$
V_{escape} = 5021 m/s = 5.021 km/s

107

Why is there no H_2 in the atmosphere of the inner planets?

$E_k=1/2mv^2$	J	Kinetic energy due to motion with velocity, v
$E_k=3/2kT$	J	Thermal kinetic energy of gas, atoms or molecules
$v=(3kT/m)^{1/2}$	m/s	Average speed of a gas, atom or molecule
$k=1.38x10^{-23}$	J/K	Boltzmann's constant
$m = \mathcal{M}$ x amu	kg	mass of atom or molecule
$\mathcal{M}$		mass number
amu= 1.66×10^{-27} kg		atomic mass unit

Example for Mars: T=220K, H_2 : $\mathcal{M}$=2, m= $2x1.66x10^{-27}$ kg
$v=[(3x1.38x10^{-23}x220/(2x1.66x10^{-27})]^{1/2}$ =1656 m/s
A planet or moon can retain a gas if the escape speed is at least 6 times greater than the average velocity of the gas.
V_{esc}=5.02 km/s =3.0 x v ➔ H_2 cannot be retained by Mars.

108
