EXPANDED COURSE DESCRIPTION

Lassonde School of Engineering
Earth and Space Science and Engineering

LE / PHYS 4350 6.0 SECTION A
SPACE HARDWARE
FALL 2017 / WINTER 2018

Last Modified Date: 08/29/2017

COURSE CALENDAR DESCRIPTION

Explores the theoretical, practical and experimental techniques needed to acquire and manipulate typical signals used in spacecraft system operations or integration and testing. Three laboratory hours and two lecture hours per week. Prerequisites: SC/CSE 1540 3.00 or SC/CSE 2031 3.00, or equivalent programming experience; SC/PHYS 3150 3.00; SC/PHYS 3250 3.00. Corequisite: SC/ENG 4330 3.00 and SC/PHYS 4330 3.00.

Course Listed Courses: ENG 4350 , ENG 4350

ADDITIONAL INFORMATION

TOPICS AND CONCEPTS
The course provides a review of electrical/electronic circuit and signal theory, which is applied to the analysis and measurement of analog, digital and RF circuits in the weekly labs. The course provides additional hands-on experience with laboratory equipment used in previous courses such as oscilloscopes, but additional equipment is also introduced such as spectrum and network analyzers and others.

Students are also exposed throughout the course to various related software tools. Software applications include data acquisition (such as LabVIEW), FPGA design and simulation (such as Altium Designer), programming and/or simulation languages (such as Python, C, Java, VHDL, Open Modelica, etc).

COURSE SYLLABUS
The course is divided into 4 sections: Analog, Digital, RF and Programming. Each section is a half-semester in length. Assessments for each section vary somewhat, but generally consist of 5 short lab write-ups for each lab, handed in each week, 2 mini-quizzes (or assignments) and a final written quiz.

Students are also asked to write the Beginner and Advanced Amateur Radio Operator exams and to take one of the STK Certification tests as part of the course. The final section of the course on programming culminates in a field trip to the Algonquin Radio Observatory to test the student-developed code for tacking navigation satellites.

COURSE OVERVIEW
Normally on any space or development project various hardware components are brought together and tested. This course provides you with the experience to understand how the testing is conducted. In order to interpret the measurements being made correctly, the underlying theory should be understood. To help with this lectures will review and in some cases expand on previous courses in signals and systems as well as
electrical circuits and RF communications.

The experiments performed in the course roughly correspond to systems one would encounter in data acquisition on a spacecraft or ground system.

GRADED ASSESSMENT
Student achievement is assessed based on lab write-ups, mini-quizzes or assignments and a final quiz in each of the 4 sections of the course.

MARKS
Each of the 4 section is given equal weight towards the final mark for the course. A rough breakdown of marks for each section is as follows:

Section Quiz – 30%
Mini-Quizzes, Assignments – 30%
Lab Write-ups – 40%

There is some variation between the sections. For example in the programming section a write-up of the code performance achieved during the field trip replaces the section quiz component for that section.
