Doppler effect

Giordano 13.56&57

Problem:

- A bat uses a 60 kHz ultrasound wave to track an insect initially 30 cm away, then moving to be 40 cm away.
- Find the difference in echo times.
- If the insect moved the 10 cm directly away in a time of 0.50 sec, what is the magnitude of the frequency shift of the reflected wave picked up by the bat?

Relevant ideas:

Relevant ideas:

- Consider relative motion, i.e., use the bat's frame as a reference.

Relevant ideas:

- Consider relative motion, i.e., use the bat's frame as a reference.
- For observers moving away from a stationary source there is a frequency decrease.

Relevant ideas:

- Consider relative motion, i.e., use the bat's frame as a reference.
- For observers moving away from a stationary source there is a frequency decrease.
- The reflected waves (of decreased frequency) are perceived by the bat as coming from a receding source.

Equations associated with ideas:

1) $t_1 = \frac{2x_1}{v_s}$; $t_2 = \frac{2x_s}{v_s}$; $\Delta t = t_2 - t_1$

2) Doppler - moving observer
stationary source $f_{\text{obs}} = f_{\text{src}} \left(1 - \frac{v_{\text{obs}}}{v_s} \right)$
obs. moves away

3) Doppler - moving source
stationary observer $f_{\text{obs}} = \frac{f_{\text{src}}}{1 + \frac{v_{\text{src}}}{v_s}}$

To lowest order in $\frac{v_{\text{src}}}{v_s}$ or $\frac{v_{\text{obs}}}{v_s}$ it doesn't matter

whether one distinguishes between cases (2), (3).

There is an $\mathcal{O}\left(\left(\frac{v}{v_s}\right)^2\right)$ difference which for $v \ll v_s$ is negligible.

Strategy

Strategy

- The signal travels from the bat to the insect and back, i.e., twice the distance at v_s .

Strategy

- The signal travels from the bat to the insect and back, i.e., twice the distance at v_s .
- The insect is treated as a moving observer, then it gives off the reflected waves at the shifted frequency.

Strategy

- The signal travels from the bat to the insect and back, i.e., twice the distance at v_s .
- The insect is treated as a moving observer, then it gives off the reflected waves at the shifted frequency.
- The bat observes the reflected waves from a moving source.

Strategy

- The signal travels from the bat to the insect and back, i.e., twice the distance at v_s .
- The insect is treated as a moving observer, then it gives off the reflected waves at the shifted frequency.
- The bat observes the reflected waves from a moving source.
- The Doppler effect kicks in twice.

Solution

Solution

- $\Delta t = t_2 - t_1 = \frac{2}{v_s} (x_2 - x_1) = \frac{0.2}{343} \text{ s} = 0.6 \text{ ms}$ we lost ~ one significant digit

Solution

- $\Delta t = t_2 - t_1 = \frac{2}{v_s} (x_2 - x_1) = \frac{0.2}{343} \text{ s} = 0.6 \text{ ms}$

we lost ~ one significant digit
- $f_{\text{obs}} = f_{\text{src}} \left(1 - \frac{v_{\text{obs}}}{v_s}\right) ; v_{\text{obs}} = \frac{0.1}{0.5} \frac{\text{m}}{\text{s}} = 0.2 \frac{\text{m}}{\text{s}}$

Solution

- $\Delta t = t_2 - t_1 = \frac{2}{v_s} (x_2 - x_1) = \frac{0.2}{343} \text{ s} = 0.6 \text{ ms}$ we lost ~ one significant digit

- $f_{\text{obs}} = f_{\text{src}} \left(1 - \frac{v_{\text{obs}}}{v_s}\right)$; $v_{\text{obs}} = \frac{0.1}{0.5} \frac{\text{m}}{\text{s}} = 0.2 \frac{\text{m}}{\text{s}}$

- reflected waves produced with $f_{\text{obs}} = 59.965 \text{ kHz}$

Solution

- $\Delta t = t_2 - t_1 = \frac{2}{v_s} (x_2 - x_1) = \frac{0.2}{343} \text{ s} = 0.6 \text{ ms}$ we lost ~ one significant digit
 - $f_{\text{obs}} = f_{\text{src}} \left(1 - \frac{v_{\text{obs}}}{v_s}\right)$; $v_{\text{obs}} = \frac{0.1}{0.5} \frac{\text{m}}{\text{s}} = 0.2 \frac{\text{m}}{\text{s}}$
 - reflected waves produced with $f_{\text{obs}} = 59.965 \text{ kHz} = f_R$
 - bat : $f_{\text{obs}} = \frac{f_R}{1 + v_{\text{src}}/v_s}$; $v_{\text{src}} = 0.2 \frac{\text{m}}{\text{s}}$; $f^{\text{echo}} = 59.930 \text{ kHz}$
- Frequency shift $\Delta f = f^{\text{emitted}} - f^{\text{echo}} = 70 \text{ Hz}$
