

SAMPLE ASSIGNMENT

Here are examples of swimming speeds and size for a variety of organisms, from bacteria to whales¹. What is the relation between speed and size? What are the physical constraints that result in such an apparent strong correlation between speed *versus* size?

Swimming speed and length in animals.

Species	Length	Swimming Speed (cm/sec)	Reference
1. <i>Bacillus subtilis</i>	2.5 μm	1.5×10^{-3}	<i>Tabulae Biologicae</i>
2. <i>Spirillum volutans</i>	13.0 μm	1.1×10^{-2}	idem
3. <i>Euglena</i> sp.	38.0 μm	2.3×10^{-2}	idem
4. <i>Paramecium</i> sp.	220.0 μm	1.0×10^{-1}	idem
5. <i>Unionicola ypsilophorus</i> (water mite)	1.3 mm	4.0×10^{-1}	Welsh (1932, <i>J. Gen. Physiol.</i> 16:349)
6. <i>Pleuronectes platessa</i> (plaice, larval)	7.6 mm	6.4	Boyar (1961, <i>Trans. Amer. Fish. Soc.</i> 90:21)
7. <i>P. platessa</i>	9.5 mm	11.5	idem
8. <i>Carassius auratus</i> (goldfish)	7.0 mm	75	Bainbridge (1961, <i>Symp. Zool. Soc. London</i> 5:13)
9. <i>Leuciscus leuciscus</i> (European dace)	10.0 cm	130	idem
10. <i>L. leuciscus</i>	15.0 cm	175	idem
11. <i>L. leuciscus</i>	20.0 cm	220	idem
12. <i>Pomolobus pseudo harengus</i> (river herring)	30.0 cm	440	Dow (1962, <i>J. Conseil Internat. Explor. Mer</i> 27:77)
13. <i>Pygoscelis adeliae</i> (Adélie penguin)	75.0 cm	380	Meinertzhagen (1955, <i>Ibis</i> 97:81)
14. <i>Thunnus albacares</i> (yellowfin tuna)	98.0 cm	2,080	Walters and Firestone (1964, <i>Nature</i> 202:208)
15. <i>Acanthocybium solanderi</i> (wahoo)	1.1 m	2,150	idem
16. <i>Delphinus delphis</i> (common dolphin)	2.2 m	1,030	Hill (1950, <i>Sci. Prog.</i> 38:209)
17. <i>Sibbaldus musculus</i> (blue whale)	26.0 m	1,030	idem

Hints:

The drag coefficient (C_d) and its relation to the Reynolds number (Re) may give some insight into the effect of size on speed. At what size does turbulent flow dominate ($Re > 1$)?

The viscosity (η) of water is $1.787 \cdot 10^{-3}$ poise at 0°C, $1.002 \cdot 10^{-3}$ poise at 20°C, $0.653 \cdot 10^{-3}$ poise at 40°C. A poise has units of Pa sec; Pascal (Pa) has units of $N\ m^{-2}$; Newton (N) has units of $kg\ m\ sec^{-1}$. The kinematic viscosity (ν) of water is $1.787 \cdot 10^{-6}$ $m^2\ sec^{-1}$ at 0°C, $1.004 \cdot 10^{-6}$ $m^2\ sec^{-1}$ at 20°C, $0.658 \cdot 10^{-6}$ $m^2\ sec^{-1}$ at 40°C. The kinematic viscosity is the viscosity divided by the density ($\nu = \eta/\rho$) ($m^2\ sec^{-1} = N\ m^{-2} / kg\ m^{-3}$).
